(Brief narrative of accident. Include statement of responsibility and recommendations for action to prevent repetition)

NARRATIVE:

Returning from an operational mission on the afternoon of 13 January 1945, Capt. Sears was unable to extend his right main landing gear. After exhausting every possibility of lowering this gear, he retracted his left gear and nose gear and made a successful wheels up landing.

A complete investigation has been delayed because the aircraft is at a considerable distance from its home base. Therefore, the aircraft has not yet been lifted, and the gear has not been extended for investigation. However, based on previous similar experience it is believed that excessive overtravel of the uplock prevented lowering of the right gear. An Unsatisfactory Report is being submitted concerning this condition.

RESPONSIBILITY:

Materiel failure.

RECOMMENDATIONS:

It is felt that a mechanical release installation for the main gear of this aircraft would eliminate a definite source of trouble.

INCLOSURES:

Incl. #1 - Statement of Pilot.

Incl. #2 - Statement of Gunner.

Incl. #3 - Statement of Group Engineering Officer.

Incl. #4 - Statement of Crew Chief.
Incl. #5 - Statement of Squadron Engineering Officer

Incl. #6 - Unsatisfactory Report.

THEODORE R. AYLESWORTH.

Colonel, Air Corps.

Commanding.

Captain. Air Corps.

Investigating Officer.

Date 20 January 1945

with production and

16 January 1945.

STATEMENT

On the afternoon of 13 January 1945 I took off from A-55 in A-26B aircraft, serial number 41-39210 on a combat mission. Take off and retraction of wheels was normal.

On completion of operations the formation was diverted to A-69. Just prior to landing I had called my gunner, M/Sgt. Wells, up to the cockpit to clean my windshield, which was iced. On the landing pattern I slowed my aircraft to 150 M.P.H., I.A.S. The wheels apparently came down normally, for the green light on the instrument panel came on and the hydraulic pressure after the initial drop returned to 1000 lbs. per square inch. The selsyn indicator had been written up in the form IA prior to flight as being out, so I paid no attention to it. I checked the left wheel visually and it was down and locked. M/Sgt. Wells checked the right wheel visually and found that it had not come down out of the nacelle, nor had the wheel well door opened. I circled A-69 for about one hour and a half, endeavoring to get the right wheel down. I tried the normal system numerous times by raising the other two wheels, slowing the aircraft down, and suddenly putting the landing gear lever in the down position. The right wheel still would not come out of the nacelie, nor would the wheel well door open.

I then tried the emergency hydraulic system, which procedure consisted of putting the emergency hydraulic selector valve in the "landing gear down" position, having my gunner actuate the hydraulic hand pump, while I maintained the aircraft at 150 M.P.H., I.A.S. This procedure likewise failed to bring the right wheel out of the nacelle.

We then alternated between the normal hydraulic system and the emergency hydraulic system, but had no success with either. It took all of my gunner's strength to actuate the hydraulic hand pump while endeavoring to use the emergency system.

We then climbed the sircraft to 5000 feet and dropped full flaps and did a power stall I.A.S. 100 M.P.H. While the aircraft was shuddering and shaking, we again tried both systems for bringing the wheels down. We were still unsuccessful in getting the right gear out of the nacelle.

We circled the field for about 20 more minutes, trying both hydraulic systems, but were still unsuccessful. Every time the nose wheel and left main wheel were down and locked, the green light on the instrument panel would dome on.

After exhausting all possible means of getting all wheels down and locked, I received instructions from the box leader, Major Price, to bring the aircraft in for a belly landing. The belly landing was accomplished successfully, and no personnel were intured.

Cuteruf C. Sears.

AUBRET C. SEARS.

Captain, Mir Corps.

477.

17 January 1945.

STATEMENT

On the afternoon of 13 January 1945 I flew as gunner in A-26B aircraft serial number 41-39210 on a combat mission with Captain Sears as pilot.

On completion of the mission we were diverted to A-69. Prior to landing, the pilot called me to the front cockpit to clean the windshield. In the landing pattern the pilot slowed the aircraft to 150 M.P.H., I.A.S. and put the landing gear lever in wheels down position. The nose and left main gear came down and locked, but the right main gear stayed in the nacelle. The green light on the instrument panel came on and the hydraulic pressure returned to 1000 pounds per square inch after the initial drop.

We tried raising and lowering the gear by the normal hydraulic system numerous times, but were unsuccessful in getting the right main gear to drop.

We then tried to extend the right gear by using the emergency hydraulic system. We did this by placing the emergency hydraulic selector valve in "landing gear down" position while I actuated the hand hydraulic pump. We were not able to extend the right gear by this means. We then alternated between the normal hydraulic system and the emergency hydraulic system, but were still unsuccessful in extending the right gear.

The pilot climbed the sircraft to 5000 feet and did a power stall, I.A.S. 100 M.P.H. While the aircraft was shuddering we tried both systems for extending the gear, but were still unsuccessful.

We then circled the field for about twenty minutes trying to get the wheels down and locked. The pilot, after calling the box leader by radio, told me to prepare for a belly landing. I returned to the gunner's compartment and cut off all of my turret switches and brought the fire axe forward. The pilot accomplished the belly landing successfully. No personnel were injured.

JIMHIB J. WELLS, M/Sgt., 10601546.

Inel. #3

S-T-A-T-E-M-E-N-T

18 January 1945

I investigated A-26B aircraft, No 41-39210, which made a belly landing at station A-69. Due to the fact that the aircraft had not been lifted up as yet, it was impossible to discover the reason for the failure of one main landing gear to extend. However, in view of past experience with this trouble it is suspected that there was excessive overtravel on the main landing gear lock which prevented the actuating cylinder from lifting the lock high enough to unlock the gear. As the actuating cylinder will only lift the lock 6/16 of an inch and the overtravel is adjusted to 5/16 of an inch, which allows a clearance of 1/16 inch, then if the lock adjustment exceeds 6/16 of an inch, the gear will not unlock. No emergency system is provided.

U. R. No. 45-17; 19-1-45, 671st Bemb. Sq. (L), Station 4-55. Contt.

RECOMMENDATION.

- A. That a bungee be incorporated on the main landing gear system of the 4-26 type airplane similar to that on the 4-20 Type airplane. This should have enough pressure on it to held the link assembly main landing gear retracting until the cap on the latch assembly is clear of the cam and thus preventing stretching of the red assembly and climinating the slipping of the everlap adjustment.
- B. That a manual release for lifting and breaking the locking effect of these latch cap assemblys be installed on the main landing gears of the A-26 type aircraft. This would assure a positive means of releasing the gear assembly when either locked up or down.

ALVIN H. THIME, JR., Captain, Air Corps, Engineering Officer.
